

### 304 Stainless steel alkaline flask

The common purified water is of macromolecule group with acidity, no mineral element. If you drink it for long term, the immunity will be brought down.

Filter inside nanometer energy cup has pearl calcium ion and energy stone, they can release far infrared ray and negative ion. Resonance will happen between them and water molecules, which will release mineral element (such as Ca, Mg, K, Na) and change ordinary purified water into nanometer activated water. Nanometer activated water is made up of macromolecules group, with negative potential & alkalescence, It has strong penetrability and solubility;

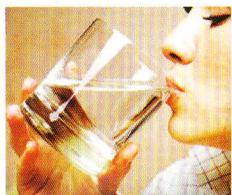

1.wash the cup

2.pour water into...

3.wait for 3 minutes

4. open and drink

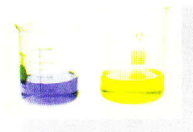

### Life time :

1-2 years for energy stone.  
If you find sediment adhering to the cup, clear it with hot salt water.  
Wash it once a month.

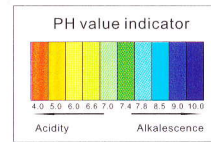

### The test method:

#### 1. Test the PH value

Take 1 cup of ordinary purified water & 1 cup of nanometer activated water, put 1 pc of delicate chemical reagent test paper into each cup, the test result will show that color of ordinary purified water become yellow (the PH value is 5.5), and nanometer activated water become blue (The PH value is 7.5-9.5)

Test 1.

PH value

#### 2. Test the affinity with edible-oil

Take 1 cup of ordinary purified water & 1 cup of nanometer activated water, pour into commensurate edible oil and stir it. As the different specific gravity, the edible oil will float on ordinary purified water, but as the strong penetrability and solubility of the nanometer activity water, the edible-oil will dissolve in water.

Test2.

Test 3.

#### 3. Test the function of detoxification

Take 1 cup of common purified water & 1 cup of nanometer activated water, drop in a little iodine, the common purified water become yellow, and the nanometer activated water is still clear, because it can neutralize the iodine.

#### 4. Test the ORP value

Oxidation Reduction Potential (ORP, or Redox) is a measure of a water system capacity to either release or gain electrons in chemical reactions.

Test4.

ORP value

### Features:

1. Alkaline water: Make the drinking water to be alkaline, neutralize human bodies, acidic substances and keep balance of the body system.
2. Negative potential water: Normal water will be adjusted to negative potential water with an ORP below  $-200\text{mV}$  in about 5 minutes. It is a strong anti-oxidant which removes free radicals, enhance immunity and keep us from aging.
3. Add beneficial microelements: Various natural mineral substances are set out which provide body with necessary microelements and improve body organs to grow healthy.
4. Energized water with small molecular group: With strong osmosis, diffusibility and oxygen-affinity, nutrients and more oxygen brought by energized water are easily absorbed into our body cells, and easily take the waste and toxins away from our body cells. It will greatly improve our metabolism.
